

ABSTRACT

A method for conveying a Small Computer System Interface (SCSI) command from a host to a logical volume, the method consisting of incorporating an indication of an address of the logical volume in the SCSI command so as to
5 generate a modified SCSI command. The method further includes conveying the modified SCSI command from the host to a target device, receiving the modified SCSI command at the target device and recovering the address from the
10 modified SCSI command. In response to the recovered address, the SCSI command is executed at the logical volume.
